Part I. Inequalities arising from the Nature of the Employments themselves.

urn:nbn:de:gbv:45:1-1628

THE NATURE AND CAUSES OF

122

BOOK THE particular confideration of those circumstances and of that policy will divide this chapter into two parts.

## PART I.

Inequalities arising from the Nature of the Employments themselves.

THE five following are the principal circumstances which, so far as I have been able to observe, make up for a small pecuniary gain in some employments, and counter-balance a great one in others: first, the agreeableness or disagreeableness of the employments themselves; secondly, the easiness and cheapness, or the difficulty and expence of learning them; thirdly, the constancy or inconstancy of employment in them; fourthly, the small or great trust which must be reposed in those who exercise them; and, fifthly, the probability or improbability of success in them.

First, The wages of labour vary with the ease or hardship, the cleanlines or dirtines, the honourableness or dishonourableness of the employment. Thus in most places, take the year round, a journeyman taylor earns less than a journeyman weaver. His work is much easier. A journeyman weaver earns less than a journeyman smith. His work is not always easier, but it is much cleanlier. A journeyman blacksmith, though an artisticer, seldom earns so much in twelve hours as a collier, who is only a labourer, does in eight. His work is not quite so dirty, is less dangerous, and is carried on in day-light, and above ground. Honour makes a great part of the reward of all honourable professions. In point of pecuniary gain, all things considered, they are generally under-recompensed, as I shall endeavour to show by and by. Disgrace has the contrary effect. The trade of a butcher

butcher is a brutal and an odious business; but it is in most places CHAP. more profitable than the greater part of common trades. The most detestable of all employments, that of public executioner, is, in proportion to the quantity of work done, better paid than any common trade whatever.

HUNTING and fishing, the most important employments of mankind in the rude state of society, become in its advanced state their most agreeable amusements, and they pursue for pleasure what they once followed from necessity. In the advanced state of fociety, therefore, they are all very poor people who follow as a trade, what other people purfue as a pastime. Fishermen have been fo fince the time of Theocritus. A poacher is every where a very poor man in Great Britain. In countries where the rigour of the law fuffers no poachers, the licenfed hunter is not in a much better condition. The natural tafte for those employments makes more people follow them than can live comfortably by them, and the produce of their labour, in proportion to its quantity, comes always too cheap to market to afford any thing but the most scanty subsistence to the labourers.

DISAGREEABLENESS and diffrace affect the profits of stock in the fame manner as the wages of labour. The keeper of an inn or tavern, who is never master of his own house, and who is exposed to the brutality of every drunkard, exercises neither a very agreeable nor a very creditable business. But there is scarce any common trade in which a small stock yields so great a profit.

SECONDLY, The wages of labour vary with the eafiness and cheapness or the difficulty and expence of learning the busi-

WHEN

воок

When any expensive machine is erected, the extraordinary work to be performed by it, before it is worn out, it must be expected, will replace the capital laid out upon it, with at least its ordinary profits. A man educated at the expence of much labour and time to any of those employments which require extraordinary dexterity and skill, may be compared to one of those expensive machines. The work which he learns to perform, it must be expected, over and above the usual wages of common labour, will replace to him the whole expence of his education, with at least the ordinary profits of an equally valuable capital. It must do this too in a reasonable time, regard being had to the very uncertain duration of human life, in the same manner as to the more certain duration of the machine.

THE difference between the wages of skilled labour and those of common labour, is founded upon this principle.

THE policy of Europe confiders the labour of all mechanicks, artificers, and manufacturers, as skilled labour; and that of all country labourers as common labour. It feems to suppose that of the former to be of a more nice and delicate nature than that of the latter. It is so perhaps in some cases; but in the greater part it is quite otherwife, as I shall endeavour to shew by and by. The laws and customs of Europe, therefore, in order to qualify any person for exercising the one species of labour, impose the necesfity of an apprenticeship, though with different degrees of rigour in different places. They leave the other free and open to every body. During the continuance of the apprenticeship, the whole labour of the apprentice belongs to his master. In the mean time he must, in many cases, be maintained by his parents or relations, and in almost all cases must be cloathed by them. Some money too is commonly given to the master for teaching him his trade. who

who cannot give money, give time, or become bound for more CHAP. than the usual number of years; a confideration which, though it is not always advantageous to the master, on account of the usual idleness of apprentices, is always disadvantageous to the apprentice. In country labour, on the contrary, the labourer, while he is employed about the easier, learns the more difficult parts of his bufiness, and his own labour maintains him through all the different stages. of his employment. It is reasonable, therefore, that in Europe the wages of mechanicks, artificers, and manufacturers, should be fomewhat higher than those of common labourers. They are so accordingly, and their fuperior gains make them in most places be confidered as a superior rank of people. This superiority, however, is generally very fmall; the daily or weekly earnings of journeymen in the more common forts of manufactures, fuch as those of plain linen and woollen cloth, computed at an average, are, in most places, very little more than the day wages of common labourers. Their employment, indeed, is more fleady and uniform, and the fuperiority of their earnings, taking the whole year together, may be fomewhat greater. It feems evidently, however, to be no greater than what is fufficient to compensate the superior expense of their education.

EDUCATION in the ingenious arts and in the liberal profefflons, is still more tedious and expensive. The pecuniary recompence, therefore, of painters and fculptors, of lawyers and physicians, ought to be much more liberal, and it is so accordingly.

THE profits of stock seem to be very little affected by the easiness or difficulty of learning the trade in which it is employed. All the different ways in which stock is commonly employed in great towns feem, in reality, to be almost equally easy and equally

BOOK equally difficult to learn. One branch either of foreign or domeftick trade, cannot well be a much more intricate bufiness than another.

> THIRDLY, The wages of labour in different occupations vary with the constancy or inconstancy of employment.

EMPLOYMENT is much more constant in some trades than in others. In the greater part of manufactures, a journeyman may be pretty fure of employment almost every day in the year that he is able to work. A mason or bricklayer, on the contrary, can work neither in hard frost nor in foul weather, and his employment at all other times depends upon the occasional calls of his cuflomers. He is liable, in confequence, to be frequently without any. What he earns, therefore, while he is employed, must not only maintain him while he is idle, but make him fome compensation for those anxious and desponding moments which the thought of fo precarious a fituation must sometimes occasion. Where the computed earnings of the greater part of manufacturers, accordingly, are nearly upon a level with the day wages of common labourers, those of masons and bricklayers are generally from onehalf more to double those wages. Where common labourers earn four and five shillings a week, masons and bricklayers frequently earn feven and eight; where the former earn fix, the latter often earn nine and ten; and where the former earn nine and ten, as in London, the latter commonly earn fifteen and eighteen. No species of skilled labour, however, seems more easy to learn than that of masons and bricklayers. Chairmen in London, during the summer feafon, are faid fometimes to be employed as bricklayers. The high wages of those workmen, therefore, are not so much the recompence of their skill, as the compensation for the inconstancy of their employment. count towns from in contry to be

A HOUSE

A HOUSE carpenter feems to exercise rather a nicer and more CHAP. ingenious trade than a mason. In most places, however, for it is not univerfally fo, his day-wages are somewhat lower. His employment, though it depends much, does not depend fo entirely upon the occasional calls of his customers; and it is not liable to be interrupted by the weather.

the rate at which they were then paid, they could care from the

WHEN the trades which generally afford constant employment, happen in a particular place not to do fo, the wages of the workmen always rife a good deal above their ordinary proportion tothose of common labour. In London almost all journeymen artificers are liable to be called upon and difmiffed by their mafters from day to day, and from week to week, in the fame manner as day-labourers in other places. The lowest order of artificers, journeymen taylors, accordingly earn there half a crown a-day, though eighteen-pence may be reckoned the wages of common labour. In fmall towns and country villages, the wages of journeymen taylors frequently scarce equal those of common labour; but in London they are often many weeks without employment, particularly during the fummer. Depart visualities for at to a short

WHEN the inconstancy of employment is combined with the hardship, disagreeableness and dirtiness of the work, it sometimes raifes the wages of the most common labour above those of the most skilful artificers. A collier working by the piece is supposed, at Newcastle, to earn commonly about double, and in many parts of Scotland about three times the wages of common labour. His high wages arise altogether from the hardship, disagreeableness, and dirtiness of his work. His employment may, upon most occasions, be as constant as he pleases. The coal-heavers in London exercise a trade which in hardship, dirtiness, and disagreeableness, almost equals that of colliers; and from the unavoidable

irregularity

7

BOOK I. irregularity in the arrivals of coal ships, the employment of the greater part of them is necessarily very inconstant. If colliers, therefore, commonly earn double and triple the wages of common labour, it ought not to feem unreafonable that coal-heavers should fometimes earn four and five times those wages. In the enquiry made into their condition a few years ago, it was found that at the rate at which they were then paid, they could earn from fix to ten shillings a-day. Six shillings are about four times the wages of common labour in London, and in every particular trade, the lowest common earnings may always be considered as those of the far greater number. How extravagant foever those earnings may appear, if they were more than fufficient to compensate all the difagreeable circumstances of the business, there would soon be fo great a number of competitors as, in a trade which has no exclusive privilege, would quickly reduce them to a lower rate.

THE constancy or inconstancy of employment cannot affect the ordinary profits of stock in any particular trade. Whether the stock is or is not constantly employed depends, not upon the trade, but the trader.

FOURTHLY, The wages of labour vary according to the small or great trust which must be reposed in the workmen.

THE wages of goldfmiths and jewellers are every where superior to those of many other workmen, not only of equal, but of much superior ingenuity; on account of the precious materials with which they are intrusted.

WE trust our health to the physician; our fortune and sometimes our life and reputation to the lawyer and attorney. Such confidence confidence could not fafely be reposed in people of a very mean or CHAP. low condition. Their reward must be such, therefore, as may give them that rank in the fociety which fo important a trust requires. The long time and the great expence which must be laid out in their education, when combined with this circumstance, necessarily enhance still further the price of their la-

WHEN a person employs only his own stock in trade, there is no truft; and the credit which he may get from other people, depends, not upon the nature of his trade, but upon their opinion of his fortune, probity, and prudence. The different rates of profit, therefore, in the different branches of trade, cannot arise from the different degrees of trust reposed in the traders.

FIFTHLY, The wages of labour in different employments vary according to the probability or improbability of fuccess in them.

THE probability that any particular person shall ever be qualified for the employment to which he is educated, is very different in different occupations. In the greater part of mechanick trades, fuccess is almost certain; but very uncertain in the liberal profesfions. Put your fon apprentice to a shoemaker, there is little doubt of his learning to make a pair of shoes: But fend him to fludy the law, it is at least twenty to one if ever he makes such proficiency as will enable him to live by the bufinefs. In a perfectly fair lottery, those who draw the prizes ought to gain all that is loft by those who draw the blanks. In a profession where twenty fail for one that fucceeds, that one ought to gain all that should have been gained by the unsuccessful twenty. The VOL. I. counfellor

counsellor at law who, perhaps, at near forty years of age, begins to make fomething by his profession, ought to receive the retribution, not only of his own fo tedious and expensive education, but of that of more than twenty others who are never likely to make any thing by it. How extravagant foever the fees of counfellors at law may fometimes appear, their real retribution is never equal to this. Compute in any particular place, what is likely to be annually gained, and what is likely to be annually spent, by all the different workmen in any common trade, fuch as that of shoemakers or weavers, and you will find that the former fum will generally exceed the latter. But make the same computation with regard to all the counfellors and students of law, in all the different inns of court, and you will find that their annual gains bear but a very fmall proportion to their annual expence, even though you rate the former as high, and the latter as low, as can well be done. The lottery of the law, therefore, is very far from being a perfectly fair lottery; and that, as well as many other liberal and honourable professions, are, in point of pecuniary gain, evidently under-recompenced.

THOSE professions keep their level, however, with other occupations, and, notwithstanding these discouragements, all the most generous and liberal spirits are eager to crowd into them. Two different causes contribute to recommend them. First, the desire of the reputation which attends upon superior excellence in any of them; and, secondly, the natural confidence which every man has more or less, not only in his own abilities, but in his own good fortune.

To excel in any profession, in which but few arrive at mediocrity, is the most decisive mark of what is called genius or superior talents. The publick admiration which attends upon such distinguished and fairits, valued more than

tinguished abilities, makes always a part of their reward; a greater CHAP. or smaller in proportion as it is higher or lower in degree. It makes a considerable part of it in the profession of physick; a still greater perhaps in that of law; in poetry and philosophy it makes almost the whole.

THERE are some very agreeable and beautiful talents of which the possession commands a certain fort of admiration; but of which the exercise for the sake of gain is considered, whether from reason or prejudice, as a fort of publick proftitution. The pecuniary recompence, therefore, of those who exercise them in this manner, must be sufficient, not only to pay for the time, labour, and expence of acquiring the talents, but for the discredit which attends the employment of them as the means of fubfiftence. The exorbitant rewards of players, opera-fingers, opera-dancers, &c. are founded upon those two principles; the rarity and beauty of the talents, and the difcredit of employing them in this manner. It feems abfurd at first fight that we should despife their persons, and yet reward their talents with the most profuse liberality. While we do the one, however, we must of necessity do the other. Should the publick opinion or prejudice ever alter with regard to fuch occupations, their pecuniary recompence would quickly diminish. More people would apply to them, and the competition would quickly reduce the price of their labour. Such talents, though far from being common, are by no means fo rare as is imagined. Many people possess them in great perfection, who disdain to make this use of them; and many more are capable of acquiring them, if any thing could be made honourably by them.

THE over-weening conceit which the greater part of men have of their own abilities, is an antient evil remarked by the philosophers and moralists of all ages. Their absurd presumption in S 2

132

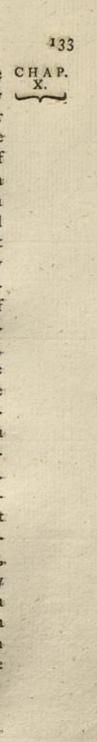

BOOK their own good fortune, has been less taken notice of. It is, however, if possible, still more universal. There is no man living who, when in tolerable health and spirits, has not some share of it. The chance of gain is by every man more or lefs over-valued, and the chance of loss is by most men under-valued, and by scarce any man, who is in tolerable health and spirits, valued more than it is worth.

> THAT the chance of gain is naturally overvalued, we may learn from the universal success of lotteries. The world neither ever faw, nor ever will fee, a perfectly fair lottery; or one in which the whole gain compensated the whole loss; because the undertaker could make nothing by it. In the flate lotteries the tickets are really not worth the price which is paid by the original fubscribers, and yet commonly fell in the market for twenty, thirty, and fometimes forty per cent. advance. The vain hope of gaining fome of the great prizes is the fole cause of this demand. The foberest people scarce look upon it as a folly to pay a small sum for the chance of gaining ten or twenty thousand pounds; though they know that even that small fum is perhaps twenty or thirty per cent. more than the chance is worth. In a lottery in which no prize exceeded twenty pounds, though in other respects it approached much nearer to a perfectly fair one than the common state lotteries, there would not be the same demand for tickets. In order to have a better chance for some of the great prizes, some people purchase several tickets, and others, small shares in a still greater number. There is not, however, a more certain proposition in mathematicks than that the more tickets you adventure upon, the more likely you are to be a lofer. Adventure upon all the tickets in the lottery, and you lose for certain; and the greater the number of your tickets the nearer you approach to this certainty.

> > THAT

THAT the chance of loss is frequently undervalued, and scarce CHAP. ever valued more than it is worth, we may learn from the very moderate profit of infurers. In order to make infurance, either from fire or fea risk, a trade at all, the common premium must be fufficient to compensate the common losses, to pay the expence of management, and to afford fuch a profit as might have been drawn from an equal capital employed in any common trade. The person who pays no more than this, evidently pays no more than the real value of the rifk, or the lowest price at which he can reasonably expect to infure it. But though many people have made a little money by infurance, very few have made a great fortune; and from this confideration alone it feems evident enough that the ordinary balance of profit and loss is not more advantageous in this than in other common trades by which fo many people make fortunes. Moderate, however, as the premium of infurance commonly is, many people despise the risk too much to care to pay it. Taking the whole kingdom at an average, nineteen houses in twenty, or rather perhaps ninety-nine in a hundred, are not infured from fire. Searisk is more alarming to the greater part of people, and the proportion of ships infured to those not insured is much greater. Many fail, however, at all feafons and even in time of war, without any infurance. This may fometimes, perhaps, be done without any imprudence. When a great company, or even a great merchant, has twenty or thirty ships at sea, they may, as it were, infure one another. The premium faved upon them all, may more than compensate such losses as they are likely to meet with in the common course of chances. The neglect of infurance upon shipping, however, in the same manner as upon houses, is, in most cases, the effect of no such nice calculation, but of mere thoughtless rashness and presumptuous contempt of the risk.

THE contempt of risk and the presumptuous hope of success, are in no period of life more active than at the age at which young people

BOOK people chuse their professions. How little the fear of misfortune is then capable of balancing the hope of good luck, appears still more evidently in the readiness of the common people to enlist as foldiers or to go to fea, than in the eagerness of those of better fashion to enter into what are called the liberal professions.

> WHAT a common foldier may lose is obvious enough. Without regarding the danger, however, young volunteers never enlift fo readily as at the beginning of a new war; and though they have fcarce any chance of preferment, they figure to themselves in their youthful fancies a thousand occasions of acquiring honour and distinction which never occur. These romantick hopes make the whole price of their blood. Their pay is less than that of common labourers, and in actual fervice their fatigues are much greater.

> THE lottery of the fea is not altogether fo difadvantageous as that of the army. The fon of a creditable labourer or artificer may frequently go to sea with his father's consent; but if he enlists as a foldier, it is always without it. Other people fee fome chance of his making fomething by the one trade: Nobody but himfelf fees any of his making any thing by the other. The great admiral is less the object of publick admiration than the great general, and the highest fuccess in the sea service promises a less brilliant fortune and reputation than equal fuccess in the land. The fame difference runs through all the inferior degrees of preferment in both. By the rules of precedency a captain in the navy ranks with a colonel in the army: but he does not rank with him in the common estimation. As the great prizes in the lottery are less, the smaller ones must be more numerous. Common failors, therefore, more frequently get fome fortune and preferment than common foldiers; and the hope of those prizes is what principally recommends the trade. Though their skill and dexterity are much **fuperior**

superior to that of almost any artificers, and though their whole CHAP. life is one continual scene of hardship and danger, yet for all this dexterity and skill, for all those hardships and dangers, while they remain in the condition of common failors, they receive fcarce any other recompence but the pleasure of exercising the one and of furmounting the other. Their wages are not greater than those of common labourers at the port which regulates the rate of feamens wages. As they are continually going from port to port, the monthly pay of those who fail from all the different ports of Great Britain, is more nearly upon a level than that of any other workmen in those different places; and the rate of the port to and from which the greatest number fail, that is the port of London, regulates that of all the rest. At London the wages of the greater part of the different classes of workmen are about double those of the same classes at Edinburgh. But the failors who sail from the port of London feldom earn above three or four shillings a month more than those who fail from the port of Leith, and the difference is frequently not fo great. In time of peace, and in the merchant fervice, the London price is from a guinea to about feven and twenty shillings the calendar month. A common labourer in London, at the rate of nine or ten shillings a week, may earn in the calendar month from forty to five and forty shillings. The failor, indeed, over and above his pay, is supplied with provisions. Their value, however, may not perhaps always exceed the difference between his pay and that of the common labourer; and though it fometimes should, the excess will not be clear gain to the failor, because he cannot share it with his wife and family,

THE dangers and hair-breadth escapes of a life of adventures, instead of disheartening young people, seem frequently to recommend a trade to them. A tender mother, among the inferior ranks.

whom he must maintain out of his wages at home.

135

BOOK ranks of people, is often afraid to fend her fon to school at a seaport town, left the fight of the ships and the conversation and adventures of the failors should entice him to go to sea. The diftant prospect of hazards, from which we can hope to extricate ourselves by courage and address, is not disagreeable to us, and does not raise the wages of labour in any employment. It is otherwife with those in which courage and address can be of no avail. In trades which are known to be very unwholesome, the wages of labour are always remarkably high. Unwholefomeness is a species of disagreeableness, and its effects upon the wages of labour are to be ranked under that general head.

> In all the different employments of flock, the ordinary rate of profit varies more or less with the certainty or uncertainty of the returns. These are in general less uncertain in the inland than in the foreign trade, and in some branches of foreign trade than in others; in the trade to North America, for example, than in that to Jamaica. The ordinary rate of profit always rifes more or less with the risk. It does not, however, feem to rise in proportion to it, or so as to compensate it compleatly. Bankruptcies are most frequent in the most hazardous trades. The most hazardous of all trades, that of a fmuggler, though when the adventure fucceeds it is likewife the most profitable, is the infallible road to bankruptcy. The prefumptuous hope of fuccess seems to act here as upon all other occasions, and to entice so many adventurers into those hazardous trades, that their competition reduces the profit below what is fufficient to compensate the risk. To compensate it compleatly, the common returns ought, over and above the ordinary profits of stock, not only to make up for all occasional losses, but to afford a furplus profit to the adventurers of the fame nature with the profit of infurers. But if the common returns were fufficient

ficient for all this, bankruptcies would not be more frequent in CHAP. these than in other trades.

Or the five circumstances, therefore, which vary the wages of labour, two only affect the profits of stock; the agreeableness or disagreeableness of the business, and the risk or security with which it is attended. In point of agreeableness or disagreeableness, there is little or no difference in the far greater part of the different employments of ftock; but a great deal in those of labour; and the ordinary profit of stock, though it rifes with the rifk, does not always feem to rife in proportion to it. It should follow from all this, that, in the fame fociety or neighbourhood, the average and ordinary rates of profit in the different employments of stock should be more nearly upon a level than the pecuniary wages of the different forts of labour. They are fo accordingly. The difference, between the earnings of a common labourer and those of a well employed lawyer or physician, is evidently much greater, than that, between the ordinary profits in any two different branches of trade. The apparent difference, besides, in the profits of different trades, is generally a deception arising from our not always diftinguishing what ought to be considered as wages, from what ought to be confidered as profit.

APOTHECARIES profit is become a bye-word, denoting fomething uncommonly extravagant. This great apparent profit, however, is frequently no more than the reasonable wages of labour. The skill of an apothecary is a much nicer and more delicate matter than that of any artificer whatever; and the trust which is reposed in him is of much greater importance. He is the physician of the poor in all cases, and of the rich when the distress or danger is not very great. His reward, therefore, ought to be suitable to his skill and his trust, and it arises generally from the price at Vol. I.

BOOK which he fells his drugs. But the whole drugs which the best employed apothecary, in a large market town, will fell in a year, may not perhaps cost him above thirty or forty pounds. Though he should fell them, therefore, for three or four hundred, or at a thousand per cent. profit, this may frequently be no more than the reasonable wages of his labour charged, in the only way in which he can charge them, upon the price of his drugs. The greater part of the apparent profit is real wages difguifed in the garb of profit.

> In a fmall fea-port town, a little grocer will make forty or fifty per cent. upon a ftock of a fingle hundred pounds, while a confiderable wholefale merchant in the fame place will fcarce make eight or ten per cent. upon a stock of ten thousand. The trade of the grocer may be necessary for the conveniency of the inhabitants, and the narrowness of the market may not admit the employment of a larger capital in the business. The man, however, must not only live by his trade, but live by it fuitably to the qualifications which it requires. Befides possessing a little capital, he must be able to read, write, and account, and must be a tolerable judge too of, perhaps, fifty or fixty different forts of goods, their prices, qualities, and the markets where they are to be had cheapest. He must have all the knowledge, in short, that is necessary for a great merchant, which nothing hinders him from becoming but the want of a fufficient capital. Thirty or forty pounds a year cannot be confidered as too great a recompence for the labour of a person fo accomplished. Deduct this from the seemingly great profits of his capital, and little more will remain, perhaps, than the ordinary profits of stock. The greater part of the apparent profit is, in this cafe too, real wages.

> THE difference between the apparent profit of the retail and that of the wholesale trade, is much less in the capital than in fmall

fmall towns and country villages. Where ten thousand pounds CHAP. can be employed in the grocery trade, the wages of the grocer's labour make but a very trifling addition to the real profits of fo great a stock. The apparent profits of the wealthy retailer, therefore, are there more nearly upon a level with those of the wholesale merchant. It is upon this account that goods fold by retail are generally as cheap and frequently much cheaper in the capital than in small towns and country villages. Grocery goods, for example, are generally much cheaper; bread and butcher's-meat frequently as cheap. It costs no more to bring grocery goods to the great town than to the country village; but it costs a great deal more to bring corn and cattle, as the greater part of them must be brought from a much greater diftance. The prime cost of grocery goods, therefore, being the fame in both places, they are cheapest where the least profit is charged upon them. The prime cost of bread and butcher's-meat is greater in the great town than in the country village; and though the profit is less, therefore, they are not always cheaper there, but often equally cheap. In fuch articles as bread and butcher's-meat, the fame cause, which diminishes apparent profit, increases prime cost. The extent of the market, by giving employment to greater stocks, diminishes apparent profit; but by requiring fupplies from a greater diffance, it increases prime cost. This diminution of the one and increase of the other feem, in most cases, nearly to counter-balance one another; which is probably the reason that, though the prices of corn and cattle are commonly very different in different parts of the kingdom, those of bread and butcher's-meat are generally very nearly the same through the greater part of it.

THOUGH the profits of flock both in the wholefale and retail trade are generally less in the capital than in small towns and country villages, yet great fortunes are frequently acquired from

Γ 2 fmall

BOOK fmall beginnings in the former, and fcarce ever in the latter. In fmall towns and country villages, on account of the narrowness of the market, trade cannot always be extended as stock extends. In fuch places, therefore, though the rate of a particular perfon's profits may be very high, the fum or amount of them can never be very great, nor consequently that of his annual accumulation. In great towns, on the contrary, trade can be extended as flock increases, and the credit of a frugal and thriving man increases much faster than his stock. His trade is extended in proportion to the amount of both, and the fum or amount of his profits is in proportion to the extent of his trade, and his annual accumulation in proportion to the amount of his profits. It feldom happens, however, that great fortunes are made even in great towns by any one regular, established, and well known branch of business, but in consequence of a long life of industry, frugality, and attention. Sudden fortunes, indeed, are fometimes made in fuch places by what is called the trade of fpeculation. The fpeculative merchant exercises no one regular, established, or well known branch of business. He is a corn merchant this year, and a wine merchant the next, and a fugar, tobacco, or tea merchant the year after. He enters into every trade when he foresees that it is likely to be more than commonly profitable, and he quits it when he foresees that its profits are likely to return to the level of other trades. His profits and losses, therefore, can bear no regular proportion to those of any one established and well known branch of business. A bold adventurer may sometimes acquire a confiderable fortune by two or three fuccefsful speculations; but is just as likely to lose one by two or three unsuccessful ones. This trade can be carried on no where but in great towns. It is only in places of the most extensive commerce and correspondence that the intelligence requisite for it can be had.

> THE five circumstances above mentioned, though they occasion confiderable inequalities in the wages of labour and profits of ftock, occasion 7

occasion none in the whole of the advantages and disadvantages, CHAP. real or imaginary, of the different employments of either. The nature of those circumstances is such, that they make up for a small pecuniary gain in some, and counter-balance a great one in others.

In order, however, that this equality may take place in the whole of their advantages or disadvantages, three things are requisite even where there is the most perfect freedom. First, the employments must be well known and long established in the neighbourhood; secondly, they must be in their ordinary, or what may be called their natural state; and, thirdly, they must be the sole or principal employments of those who occupy them.

FIRST, this equality can take place only in those employments which are well known, and have been long established in the neighbourhood.

Where all other circumstances are equal, wages are generally higher in new than in old trades. When a projector attempts to establish a new manufacture, he must at first entice his workmen from other employments by higher wages than they can either earn in their own trades, or than the nature of his work would otherwise require, and a considerable time must pass away before he can venture to reduce them to the common level. Manufactures for which the demand arises altogether from fashion and fancy, are continually changing, and seldom last long enough to be considered as old established manufactures. Those, on the contrary, for which the demand arises chiefly from use or necessity, are less liable to change, and the same form or fabrick may continue in demand for whole centuries together. The wages of labour, therefore, are likely to be higher in manufactures of the former,

BOOK than in those of the latter kind. Birmingham deals chiefly in maunufactures of the former kind; Sheffield in those of the latter; and the wages of labour in those two different places, are faid to be fuitable to this difference in the nature of their manufactures.

> THE establishment of any new manufacture, of any new branch of commerce, or of any new practice in agriculture, is always a speculation, from which the projector promises himself extraordinary profits. These profits sometimes are very great, and sometimes, more frequently, perhaps, they are quite otherwise; but in general they bear no regular proportion to those of other old trades in the neighbourhood. If the project fucceeds, they are commonly at first very high. When the trade or practice becomes thoroughly established and well known, the competition reduces them to the level of other trades.

> SECONDLY, this equality in the whole of the advantages and difadvantages of the different employments of labour and stock, can take place only in the ordinary, or what may be called the natural state of those employments.

> THE demand for almost every different species of labour, is fometimes greater and fometimes less than usual. In the one case the advantages of the employment rise above, in the other they fall below the common level. The demand for country labour is greater at hay-time and harvest, than during the greater part of the year; and wages rife with the demand. In time of war, when forty or fifty thousand sailors are forced from the merchant fervice into that of the king, the demand for failors to merchant ships necessarily rifes with their scarcity, and their wages upon fuch occasions commonly rife from a guinea and seven and twenty shillings, to forty shillings and three pounds a month. In a decaying

eaying manufacture, on the contrary, many workmen, rather CHAP. than quit their old trade, are contented with smaller wages than would otherwise be suitable to the nature of their employment.

THE profits of stock vary with the price of the commodities in which it is employed. As the price of any commodity rifes above the ordinary or average rate, the profits of at least some part of the stock that is employed in bringing it to market, rife above their proper level, and as it falls they fink below it. All commodities are more or less liable to variations of price, but some are much more fo than others. In all commodities which are produced by human industry, the quantity of industry annually employed is necessarily regulated by the annual demand, in such a manner that the average annual produce may, as nearly as possible, be equal to the average annual consumption. In some employments, it has already been observed, the same quantity of industry will always produce the same, or very nearly the same quantity of commodities. In the linen or woollen manufactures, for example, the fame number of hands will annually work up very nearly the fame quantity of linen and woollen cloth. The variations in the market price of fuch commodities, therefore, can arife only from fome accidental variation in the demand. A publick mourning raises the price of black cloth. But as the demand for most forts of plain linen and woollen cloth is pretty uniform, fo is likewise the price. But there are other employments in which the fame quantity of industry will not always produce the same quantity of commodities. The fame quantity of industry, for example, will, in different years, produce very different quantities of corn, wine, hops, fugar, tobacco, &c. The price of fuch commodities, therefore, varies not only with the variations of demand, but with the much greater and more frequent variations of quantity, and is confequently extreamly fluctuating. But the profit of some of the dealers must neceffarily

144

BOOK necessarily fluctuate with the price of the commodities. The operations of the speculative merchant are principally employed about fuch commodities. He endeavours to buy them up when he forefees that their price is likely to rife, and to fell them when it is likely to fall.

> THIRDLY, This equality in the whole of the advantages and difadvantages of the different employments of labour and stock, can take place only in fuch as are the fole or principal employments of those who occupy them.

> WHEN a person derives his subsistence from one employment, which does not occupy the greater part of his time; in the intervals of his leifure he is often willing to work at another for less wages than would otherwise suit the nature of the employment.

THERE still subsists in many parts of Scotland a set of people called Cotters or Cottagers, though they were more frequent fome years ago than they are now. They are a fort of out-fervants of the landlords and farmers. The ufual reward which they receive from their mafters is a house, a small garden for pot-herbs, as much grafs as will feed a cow, and, perhaps, an acre or two of bad arable land. When their mafter has occasion for their labour, he gives them, besides, two pecks of oatmeal a week, worth about fixteen-pence sterling. During a great part of the year he has little or no occasion for their labour, and the cultivation of their own little possession is not sufficient to occupy the time which is left at their own disposal. When such occupiers were more numerous than they are at prefent, they are faid to have been willing to give their spare time for a very small recompence to any body, and to have wrought for less wages than other labourers. In antient

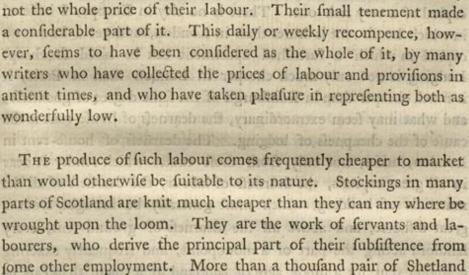

IN

tient times they feem to have been common all over Europe. In countries ill cultivated and worse inhabited, the greater part of landlords and farmers could not otherwise provide themselves with the extraordinary number of hands, which country labour requires at certain seasons. The daily or weekly recompence which such labourers occasionally received from their masters, was evidently not the whole price of their labour. Their small tenement made a considerable part of it. This daily or weekly recompence, however, seems to have been considered as the whole of it, by many writers who have collected the prices of labour and provisions in antient times, and who have taken pleasure in representing both as wonderfully low.

THE produce of such labour comes frequently cheaper to market than would otherwise be suitable to its nature. Stockings in many parts of Scotland are knit much cheaper than they can any where be wrought upon the loom. They are the work of servants and labourers, who derive the principal part of their subsistence from some other employment. More than a thousand pair of Shetland stockings are annually imported into Leith, of which the price is from sive-pence to seven-pence a pair. At Learwick, the small capital of the Shetland islands, ten-pence a day, I have been assured, is a common price of common labour. In the same islands they knit worsted stockings to the value of a guinea a pair and upwards.

THE spinning of linen yarn is carried on in Scotland nearly in the same way as the knitting of stockings, by servants who are chiefly hired for other purposes. They earn but a very scanty sub-sistence, who endeavour to get their whole livelihood by either of those trades. In most parts of Scotland she is a good spinner who can earn twenty-pence a week.

Vol. I. U

BOOK I.

In opulent countries the market is generally fo extensive, that any one trade is fufficient to employ the whole labour and flock of those who occupy it. Instances of people's living by one employment, and at the fame time deriving fome little advantage from another, occur chiefly in poor countries. The following instance, however, of fomething of the same kind is to be found in the capital of a very rich one. There is no city in Europe, I believe, in which house-rent is dearer than in London, and yet I know no capital in which a furnished apartment can be hired so cheap. Lodging is not only much cheaper in London than in Paris; it is much cheaper than in Edinburgh of the same degree of goodness; and what may feem extraordinary, the dearness of house-rent is the cause of the cheapness of lodging. The dearness of house-rent in London, arises, not only from those causes which render it dear in all great capitals, the dearness of labour, the dearness of all the materials of building, which must generally be brought from a great distance, and above all the dearness of ground-rent, every landlord acting the part of a monopolist, and frequently exacting a higher rent for a fingle acre of bad land in a town, than can be had for a hundred of the best in the country; but it arises in part from the peculiar manners and customs of the people, which oblige every mafter of a family to hire a whole house from top to bottom. A dwelling-house in England means every thing that is contained under the same roof. In France, Scotland, and many other parts of Europe, it frequently means no more than a fingle flory. A tradefman in London is obliged to hire a whole house in that part of the town where his customers live. His shop is upon the groundfloor, and he and his family fleep in the garret; and he endeavours to pay a part of his house-rent by letting the two middle stories to lodgers. He expects to maintain his family by his trade, and not by his lodgers. Whereas, at Paris and Edinburgh, the people who let lodgings, have commonly no other means of subfistence; 机 .I .Jo and
