Part II. Of the Produce of Land which sometimes does, and sometimes does not, afford Rent.

urn:nbn:de:gbv:45:1-1628

BOOK cifive proof of its nourishing quality, or of its being peculiarly fuitable to the health of the human constitution.

It is difficult to preferve potatoes through the year, and impossible to ftore them like corn, for two or three years together. The fear of not being able to fell them before they rot, discourages their cultivation, and is, perhaps, the chief obstacle to their ever becoming in any great country, like bread, the principal vegetable food of all the different ranks of the people.

### PART II.

Of the Produce of Land which sometimes does, and sometimes does not, afford Rent.

HUMAN food feems to be the only produce of land which always and necessarily affords some rent to the landlord. Other forts of produce sometimes may and sometimes may not, according to different circumstances.

AFTER food, cloathing and lodging are the two great wants of mankind.

LAND in its original rude state can afford the materials of cloathing and lodging to a much greater number of people than it can feed. In its improved state it can sometimes feed a greater number of people than it can supply with those materials, at least in the way in which they require them, and are willing to pay for them. In the one state, therefore, there is always a superabundance of those materials, which are frequently upon that account of little or no value. In the other there is often a scarcity, which necessarily augments their value. In the one state a great

part of them is thrown away as useless, and the price of what is used CHAP. is confidered as equal only to the labour and expence of fitting it for use, and can, therefore, afford no rent to the landlord. In the other they are all made use of, and there is frequently a demand for more than can be had. Somebody is always willing to give more for every part of them than what is sufficient to pay the expence of bringing them to market. Their price, therefore, can always afford fome rent to the landlord.

THE skins of the larger animals were the original materials of cloathing. Among nations of hunters and shepherds, therefore, whose food consists chiefly in the flesh of those animals, every man by providing himself with food, provides himself with the materials of more cloathing than he can wear. If there was no foreign commerce, the greater part of them would be thrown away as things of no value. This was probably the case among the hunting nations of North America, before their country was discovered by the Europeans, with whom they now exchange their furplus peltry, for blankets, fire-arms, and brandy, which gives it fome value. In the prefent commercial state of the known world, the most barbarous nations, I believe, among whom land property is established, have some foreign commerce of this kind, and find among their wealthier neighbours fuch a demand for all the materials of cloathing, which their land produces, and which can neither be wrought up nor confumed at home, as raifes their price above what it costs to fend them thither. It affords, therefore, fome rent to the landlord. When the greater part of the highland cattle were confumed on their own hills, the exportation of their hides made the most considerable article of the commerce of that country, and what they were exchanged for afforded fome addition to the rent of the highland estates. The wool of England, which in old times could neither be confumed nor wrought up at home, Dd 2

BOOK found a market in the then wealthier and more industrious country of Flanders, and its price afforded fomething to the rent of the land which produced it. In countries not better cultivated than England was then, or than the highlands of Scotland are now, and which had no foreign commerce, the materials of cloathing would evidently be fo fuper-abundant, that a great part of them would be thrown away as useless, and no part could afford any rent to the landlord.

> THE materials of lodging cannot always be transported to fo great a distance as those of cloathing, and do not so readily become an object of foreign commerce. When they are fuper-abundant in the country which produces them, it frequently happens, even in the present commercial state of the world, that they are of no value to the landlord. A good stone quarry in the neighbourhood of London would afford a confiderable rent. In many parts of Scotland and Wales it affords none. Barren timber for building is of great value in a populous and wellcultivated country, and the land which produces it, affords a confiderable rent. But in many parts of North America the landlord would be much obliged to any body who would carry away the greater part of his large trees. In some parts of the highlands of Scotland the bark is the only part of the wood which, for want of roads and water-carriage, can be fent to market. The timber is left to rot upon the ground. When the materials of lodging are fo fuper-abundant, the part made use of is worth only the labour and expence of fitting it for that use. It affords no rent to the landlord, who generally grants the use of it to whoever takes the trouble of asking it. The demand of wealthier nations, however, fometimes enables him to get a rent for it. The paving of the streets of London has enabled the owners of some barren rocks on the coast of Scotland to draw a rent from what never afforded

forded any before. The woods of Norway and of the coasts of CHAP. the Baltick, find a market in many parts of Great Britain which they could not find at home, and thereby afford some rent to their proprietors.

Countries are populous, not in proportion to the number of people whom their produce can cloath and lodge, but in proportion to that of those whom it can feed. When food is provided, it is easy to find the necessary cloathing and lodging. But though these are at hand, it may often be difficult to find food. In some parts even of the British dominions what is called A House, may be built by one day's labour of one man. The simplest species of cloathing, the skins of animals, requires somewhat more labour to dress and prepare them for use. They do not, however, require a great deal. Among savage and barbarous nations, a hundredth or little more than a hundredth part of the labour of the whole year, will be sufficient to provide them with such cloathing and lodging as satisfy the greater part of the people. All the other ninety-nine parts are frequently no more than enough to provide them with food.

But when by the improvement and cultivation of land the labour of one family can provide food for two, the labour of half the fociety becomes fufficient to provide food for the whole. The other half, therefore, or at least the greater part of them, can be employed in providing other things, or in fatisfying the other wants and fancies of mankind. Cloathing and lodging, household furniture, and what is called Equipage, are the principal objects of the greater part of those wants and fancies. The rich man confumes no more food than his poor neighbour. In quality it may be very different, and to select and prepare it may require more labour and art; but in quantity it is very nearly the same. But compare

BOOK compare the spacious palace and great wardrobe of the one, with the hovel and the few rags of the other, and you will be fenfible that the difference between their cloathing, lodging, and household furniture, is almost as great in quantity as it is in quality. The defire of food is limited in every man by the narrow capacity of the human stomach; but the desire of the conveniencies and ornaments of building, drefs, equipage, and household furniture, feems to have no limit or certain boundary. Those, therefore, who have the command of more food than they themselves can confume, are always willing to exchange the furplus, or, what is the same thing, the price of it, for gratifications of this other kind. What is over and above fatisfying the limited defire, is given for the amusement of those defires which cannot be satisfied, but feem to be altogether endless. The poor, in order to obtain food, exert themseves to gratify those fancies of the rich, and to obtain it more certainly, they vie with one another in the cheapness and perfection of their work. The number of workmen increases with the increasing quantity of food, or with the growing improvement and cultivation of the lands; and as the nature of their business admits of the utmost subdivisions of labour, the quantity of materials which they can work up, increases in a much greater proportion than their numbers. Hence arises a demand for every fort of material which human invention can employ, either usefully or ornamentally in building, dress, equipage, or household furniture; for the fossils and minerals contained in the bowels of the earth; the precious metals, and the precious stones.

> Food is in this manner, not only the original fource of rent, but every other part of the produce of land which afterwards affords rent, derives that part of its value from the improvement of the powers of labour in producing food by means of the improvement and cultivation of land.

> > THOSE

THOSE other parts of the produce of land, however, which CHAP. afterwards afford rent, do not afford it always. Even in improved and cultivated countries, the demand for them is not always such as to afford a greater price than what is sufficient to pay the labour, and replace, together with its ordinary profits, the stock which must be employed in bringing them to market. Whether it is or is not such, depends upon different circumstances.

WHETHER a coal-mine, for example, can afford any rent, depends partly upon its fertility, and partly upon its fituation.

A MINE of any kind may be faid to be either fertile or barren, according as the quantity of mineral which can be brought from it by a certain quantity of labour, is greater or less than what can be brought by an equal quantity from the greater part of other mines of the same kind.

Some coal-mines advantageously situated, cannot be wrought on account of their barrenness. The produce does not pay the expence. They can afford neither profit nor rent.

THERE are some of which the produce is barely sufficient to pay the labour, and replace, together with its ordinary profits, the stock employed in working them. They afford some profit to the undertaker of the work, but no rent to the landlord. They can be wrought advantageously by nobody but the landlord, who being himself undertaker of the work, gets the ordinary profit of the capital which he employs in it. Many coal-mines in Scotland are wrought in this manner, and can be wrought in no other. The landlord will allow no body else to work them without paying some rent, and no body can afford to pay any.

OTHER:

BOOK OTHER coal-mines in the same country sufficiently fertile, cannot be wrought on account of their fituation. A quantity of mineral fufficient to defray the expence of working, could be brought from the mine by the ordinary, or even less than the ordinary quantity of labour: But in an inland country, thinly inhabited, and without either good roads or water-carriage, this quantity could not be fold.

> COALS are a less agreeable fewel than wood: they are faid too to be less wholesome. The expence of coals, therefore, at the place where they are confumed, must generally be somewhat less than that of wood.

> THE price of wood again varies with the state of agriculture, nearly in the same manner, and exactly for the same reason, as the price of cattle. In its rude beginnings, the greater part of every country is covered with wood, which is then a mere incumbrance of no value to the landlord, who would gladly give it to any body for the cutting. As agriculture advances, the woods are partly cleared by the progress of tillage, and partly go to decay in consequence of the increased number of cattle. These, though they do not increase in the same proportion as corn, which is altogether the acquisition of human industry, yet multiply under the care and protection of men; who store up in the season of plenty what may maintain them in that of fearcity, who through the whole year furnish them with a greater quantity of food than uncultivated nature provides for them, and who by destroying and extirpating their enemies, fecure them in the free enjoyment of all that she provides. Numerous herds of cattle, when allowed to wander through the woods, though they do not destroy the old trees, hinder any young ones from coming up, fo that in the course of a century or two the whole forest goes to ruin. The scarcity of wood then raises its price.

price. It affords a good rent, and the landlord fometimes finds CHAP. that he can scarce employ his best lands more advantageously than in growing barren timber, of which the greatness of the profit often compensates the lateness of the returns. This seems in the present times to be nearly the state of things in several parts of Great Britain, where the profit of planting is found to be equal to that of either corn or pasture. The advantage which the landlord derives from planting, can no where exceed, at least for any confiderable time, the rent which these could afford him; and in an inland country which is highly cultivated, it will frequently not fall much short of this rent. Upon the sea-coast of a well improved country, indeed, if it can conveniently get coals for fewel, it may fometimes be cheaper to bring barren timber for building from lefs cultivated foreign countries, than to raise it at home. In the new town of Edinburgh, built within these few years, there is not, perhaps, a fingle stick of Scotch timber.

WHATEVER may be the price of wood, if that of coals is fuch that the expence of a coal-fire is nearly equal to that of a wood one, we may be affured, that at that place, and in these circumstances, the price of coals is as high as it can be. It feems to be so in some of the inland parts of England, particularly in Oxfordshire, where it is usual, even in the fires of the common people, to mix coals and wood together, and where the difference in the expence of those two forts of fewel cannot, therefore, be very great.

COALS, in the coal countries, are every where much below this highest price. If they were not, they could not bear the expence of a distant carriage, either by land or by water. A small quantity only could be fold, and the coal mafters and coal proprietors find it more for their interest to sell a great quantity at a price somewhat above the lowest, than a small quantity at the highest. The VOL. I. most

BOOK most fertile coal-mine too, regulates the price of coals at all the other mines in its neighbourhood. Both the proprietor and the undertaker of the work find, the one that he can get a greater rent, the other that he can get a greater profit, by fomewhat underselling all their neighbours. Their neighbours are soon obliged to fell at the same price, though they cannot so well afford it, and though it always diminishes, and sometimes takes away altogether both their rent and their profit. Some works are abandoned altogether; others can afford no rent, and can be wrought only by the proprietor.

> THE lowest price at which coals can be fold for any considerable time, is like that of all other commodities, the price which is barely fufficient to replace, together with its ordinary profits, the stock which must be employed in bringing them to market. At a coal-mine for which the landlord can get no rent, but which he must either work himself or let it alone altogether, the price of coals must generally be nearly about this price.

RENT, even where coals afford one, has generally a smaller fhare in their price than in that of most other parts of the rude produce of land. The rent of an estate above ground, commonly amounts to what is supposed to be a third of the gross produce; and it is generally a rent certain and independent of the occasional variations in the crop. In coal-mines a fifth of the gross produce is a very great rent; a tenth the common rent, and it is feldom a rent certain, but depends upon the occasional variations in the produce. These are so great, that in a country where thirty years purchase is considered as a moderate price for the property of a landed estate, ten years purchase is regarded as a good price for that of a coal-mine.

THE

The value of a coal-mine to the proprietor depends frequently as much upon its fituation as upon its fertility. That of a metallick mine depends more upon its fertility, and less upon its fituation. The coarse, and still more the precious metals, when separated from the ore, are so valuable that they can generally bear the expence of a very long land, and of the most distant sea-carriage. Their market is not confined to the countries in the neighbourhood of the mine, but extends to the whole world. The copper of Japan makes an article in the commerce of Europe; the iron of Spain in that of Chili and Peru. The silver of Peru sinds its way, not only to Europe, but from Europe to China.

THE price of coals in Westmoreland or Shropshire can have little effect on their price at Newcastle; and their price in the Lionnois can have none at all. The productions of fuch distant coal-mines can never be brought into competition with one another. But the productions of the most distant metallick mines frequently may, and in fact commonly are. The price, therefore, of the coarse, and still more that of the precious metals, at the most fertile mines in the world, must necessarily more or less affect their price at every other in it. The price of copper in Japan must have fome influence upon its price at the copper mines in Europe. The price of filver in Peru, or the quantity either of labour or of other goods which it will purchase there, must have some influence on its price, not only at the filver mines of Europe, but at those of China. After the discovery of the mines of Peru, the filver mines of Europe were, the greater part of them, abandoned. The value of filver was fo much reduced that their produce could no longer pay the expence of working them, or replace, with a profit, the food, cloaths, lodging, and other necessaries which were confumed in that operation. This was the case too with the mines of Cuba and St. Domingo, and even with the antient mines of Peru, after the discovery of those of Potosi.

E e 2

Тне

BOOK I. The price of every metal at every mine, therefore, being regulated in some measure by its price at the most fertile mine in the world that is actually wrought, it can at the greater part of mines do very little more than pay the expence of working, and can seldom afford a very high rent to the landlord. Rent, accordingly, seems at the greater part of mines to have but a small share in the price of the coarse, and a still smaller in that of the precious metals. Labour and profit make up the greater part of both.

A SIXTH part of the gross produce may be reckoned the average rent of the tin mines of Cornwal, the most fertile that are known in the world, as we are told by the Reverend Mr. Borlace, vice-warden of the stannaries. Some, he says, afford more, and some do not afford so much. A fixth part of the gross produce is the rent too of several very fertile lead mines in Scotland.

In the filver mines of Peru, we are told by Frezier and Ulloa, the proprietor frequently exacts no other acknowledgement from the undertaker of the mine, but that he will grind the ore at his mill, paying him the ordinary multure or price of grinding. The tax of the king of Spain, indeed, amounts to one-fifth of the standard filver, which may be considered as the real rent of the greater part of the filver mines of Peru, the richest which are known in the world. If there was no tax, this fifth would naturally belong to the landlord, and many mines might be wrought which cannot be wrought at present, because they cannot afford this tax. The tax of the duke of Cornwal upon tin is supposed to amount to more than five per cent. or one twentieth part of the value; and whatever may be his proportion it would naturally too belong to the proprietor of the mine, if tin was duty free. But if you add one-twentieth to one fixth, you

will find that the whole average rent of the filver mines of Cornwal, is to the whole average rent of the filver mines of Peru, as thirteen to twelve. The high tax upon filver too, gives much greater temptation to finuggling than the low tax upon tin, and finuggling must be much easier in the precious than in the bulky commodity. The tax of the king of Spain accordingly is said to be very ill paid, and that of the duke of Cornwal very well. Rent, therefore, it is probable, makes a greater part of the price of tin at the most fertile tin mines, than it does of filver at the most fertile filver mines in the world. After replacing the stock employed in working those different mines, together with its ordinary profits, the residue which remains to the proprietor is greater it seems in the coarse than in the precious metal.

NEITHER are the profits of the undertakers of filver mines commonly very great in Peru. The same most respectable and well informed authors acquaint us that when any person undertakes to work a new mine in Peru, he is universally looked upon as a man destined to bankruptcy and ruin, and is upon that account shunned and avoided by every body. Mining, it seems, is considered there in the same light as here, as a lottery in which the prizes do not compensate the blanks, though the greatness of some tempts many adventurers to throw away their fortunes in such unprosperous projects.

As the fovereign, however, derives a confiderable part of his revenue from the produce of filver mines, the law in Peru gives every possible encouragement to the discovery and working of new ones. Whoever discovers a new mine, is entitled to measure off two hundred and forty-fix feet in length, according to what he supposes to be the direction of the vein, and half as much in breadth. He becomes proprietor of this portion of the mine,

landlord. The interest of the duke of Cornwal has given occasion to a regulation nearly of the same kind in that antient dutchy. In waste and uninclosed lands any person who discovers a tin mine, may mark out its limits to a certain extent, which is called bounding a mine. The bounder becomes the real proprietor of the mine, and may either work it himself, or give it in lease to another, without the consent of the owner of the land, to whom, however, a very small acknowledgement must be paid upon working it. In both regulations the sacred rights of private property are sacrificed to the supposed interests of publick revenue.

THE same encouragement is given in Peru to the discovery and working of new gold mines; and in gold the king's tax amounts only to a twentieth part of the standard metal. It was once a fifth, as in filver, but it was found the work could not bear it. If it is rare, however, fay the fame authors, Frezier and Ulloa, to find a person who has made his fortune by a filver, it is still much rarer to find one who has done fo by a gold mine. This twentieth part feems to be the whole rent which is paid by the greater part of the gold mines in Chili and Peru. Gold too is much more liable to be fmuggled than even filver; not only on account of the fuperior value of the metal in proportion to its bulk, but on account of the peculiar way in which nature produces it. Silver is very feldom found virgin, but, like most other metals, is generally mineralized with fome other body, from which it is impossible to separate it in such quantities as will pay. for the expence, but by a very laborious and tedious operation, which cannot well be carried on but in workhouses erected for the purpose, and therefore exposed to the inspection of the king's officers. Gold, on the contrary, is almost always found virgin. It is fometimes

#### THE WEALTH OF NATIONS.

215

fometimes found in pieces of fome bulk; and even when mixed CHAP. in fmall and almost insensible particles with fand, earth, and other extraneous bodies, it can be separated from them by a very short and fimple operation, which can be carried on in any private house by any body who is possessed of a small quantity of mercury. If the king's tax, therefore, is but ill paid upon filver, it is likely to be much worse paid upon gold; and rent must make a much smaller part of the price of gold, than even of that of filver.

THE lowest price at which the precious metals can be fold, or the smallest quantity of other goods for which they can be exchanged during any confiderable time, is regulated by the fame principles which fix the lowest ordinary price of all other goods. The stock which must commonly be employed, the food, cloaths, and lodging, which must commonly be confumed in bringing them from the mine to the market, determine it. It must at least be fufficient to replace that stock, with the ordinary profits.

THEIR highest price, however, seems not to be necessarily determined by any thing but the actual fcarcity or plenty of those metals themselves. It is not determined by that of any other commodity, in the fame manner as the price of coals is by that of wood, beyond which no fcarcity can ever raife it. Increase the fcarcity of gold to a certain degree, and the smallest bit of it may become more precious than a diamond, and exchange for a greater quantity of other goods.

THE demand for those metals arises partly from their utility, and partly from their beauty. If you except iron, they are more useful than, perhaps, any other metal. As they are less liable to rust and impurity, they can more easily be kept clean; and the uten-

fils

BOOK fils either of the table or the kitchen are often upon that account more agreeable when made of them. A filver boiler is more cleanly than a lead, copper, or tin one; and the fame quality would render a gold boiler still better than a filver one. Their principal merit, however, arises from their beauty, which renders them peculiarly fit for the ornaments of dress and furniture. No paint or dye can give so splendid a colour as gilding. The merit of their beauty is greatly enhanced by their fcarcity. With the greater part of rich people, the chief enjoyment of riches confifts in the parade of riches, which in their eyes is never fo compleat as when they appear to possels those decisive marks of opulence which nobody can possess but themselves. In their eyes the merit of an object which is in any degree either useful or beautiful, is greatly enhanced by its fcarcity, or by the great labour which it requires to collect any confiderable quantity of it, a labour which no body can afford to pay but themselves. Such objects they are willing to purchase at a higher price than things much more beautiful and ufeful, but more common. These qualities of utility, beauty, and fcarcity, are the original foundation of the high price of those metals, or of the great quantity of other goods for which they can every where be exchanged. This value was antecedent to and independant of their being employed as coin, and was the quality which fitted them for that employment. That employment, however, by occasioning a new demand, and by diminishing the quantity which could be employed in any other way, may have afterwards contributed to keep up or increase their value.

> THE demand for the precious stones arises altogether from their beauty. They are of no use, but as ornaments; and the merit of their beauty is greatly enhanced by their fcarcity, or by the difficulty and expence of getting them from the mine. Wages and

and profit accordingly make up, upon most occasions, almost the CHAP. whole of their high price. Rent comes in but for a very small share; frequently for no fhare; and the most fertile mines only afford any considerable rent. When Tavernier, a jeweller, visited the diamond mines of Golconda and Vifiapour, he was informed that the fovereign of the country, for whose benefit they were wrought, had ordered all of them to be shut up except those which yielded the largest and finest stones. The others, it seems, were to the proprietor not worth the working.

As the price both of the precious metals and of the precious stones is regulated all over the world by their price at the most fertile mine in it, the rent which a mine of either can afford to its proprietor is in proportion, not to its absolute, but to what may be called its relative fertility, or to its fuperiority over other mines of the same kind. If new mines were discovered as much superior to those of Potosi as they were superior to those of Europe, the value of filver might be fo much degraded as to render even the mines of Potofi not worth the working. Before the discovery of the Spanish West Indies, the most fertile mines in Europe may have afforded as great a rent to their proprietor as the richest mines in Peru do at present. Though the quantity of filver was much less, it might have exchanged for an equal quantity of other goods, and the proprietor's fhare might have enabled him to purchase or command an equal quantity either of labour or of commodities. The value both of the produce and of the rent, the real revenue which they afforded both to the publick and to the proprietor, might have been the fame.

THE most abundant mines either of the precious metals or of the precious stones could add little to the wealth of the world. A produce of which the value is principally derived from its fcarcity, is Vol. I. necessarily

218

BOOK necessarily degraded by its abundance. A fervice of plate, and the other frivolous ornaments of dress and furniture, could be purchased for a fmaller quantity of labour, or for a fmaller quantity of commodities; and in this would confift the fole advantage which the world could derive from that abundance.

> IT is otherwise in estates above ground. The value both of their produce and of their rent is in proportion to their absolute, and not to their relative fertility. The land which produces a certain quantity of food, cloaths and lodging, can always feed, cloath and lodge a certain number of people; and whatever may be the proportion of the landlord, it will always give him a proportionable command of the labour of those people, and of the commodities with which that labour can fupply him. The value of the most barren lands is not diminished by the neighbourhood of the most fertile. On the contrary, it is generally increased by it. The great number of people maintained by the fertile lands afford a market to many parts of the produce of the barren, which they could never have found among those whom their own produce could maintain.

> WHATEVER increases the fertility of land in producing food, increases not only the value of the lands upon which the improvement is bestowed, but contributes likewise to increase that of many other lands, by creating a new demand for their produce. That abundance of food, of which, in confequence of the improvement of land, many people have the disposal beyond what they themfelves can confume, is the great cause of the demand both for the precious metals and the precious stones, as well as for every other conveniency and ornament of drefs, lodging, houshold furniture, and equipage. Food not only constitutes the principal part of the riches of the world, but it is the abundance of food which gives
